Introduction

IL-12 is a potent pro-inflammatory cytokine with promising anti-tumor activity, driven by its ability to activate both innate and adaptive immune cells. However, systemic administration of IL12 is limited by significant inflammatory toxicity and a short half-life, resulting in a narrow therapeutic margin. To overcome these challenges, strategies to reduce systemic exposure and localize IL-12 activity within the tumor microenvironment (TME) have been explored. Here, we introduce a novel approach leveraging CytomX's PROBODY® Therapeutics masking technology and Moderna's mRNA platform. Our mRNA-encoded masked IL-12 molecule is designed to remain inactive in circulation, reducing systemic toxicity, while selectively activating in the TME via elevated protease activity. This preferential activation enhances anti-tumor efficacy while improving tolerability. We demonstrate preclinical proof-of-concept in a tumor-bearing mouse model, showing that mRNA-encoded masked IL-12 is both well-tolerated and elicits robust anti-tumor responses.

Objectives / parameters investigated for masked IL-12 design :

- 1 Affinities such that mask remains intact in circulation and dissociates rapidly with protease cleavage in TME
- 2 Protease linkers stable when mRNA is translated in vivo and protein enters systemic circulation while preferentially activated in solid tumors
- 3 Half-life extension in circulation to extend duration of action and decrease dosing frequency

*IL12 cartoon for illustration purposes only

Lead mask provides >100X masking efficiency in vitro both as protein and mRNA

- Masked IL-12 constructs were first characterized in vitro as recombinant proteins for protease activation and their impact on IL-12 signalling in a HEK reporter cell line (left)
- Lead masked IL-12 molecules were evaluated as mRNA (right) prior to in vivo efficacy studies

mRNA-encoded masked IL-12 demonstrates strong anti-tumor activity

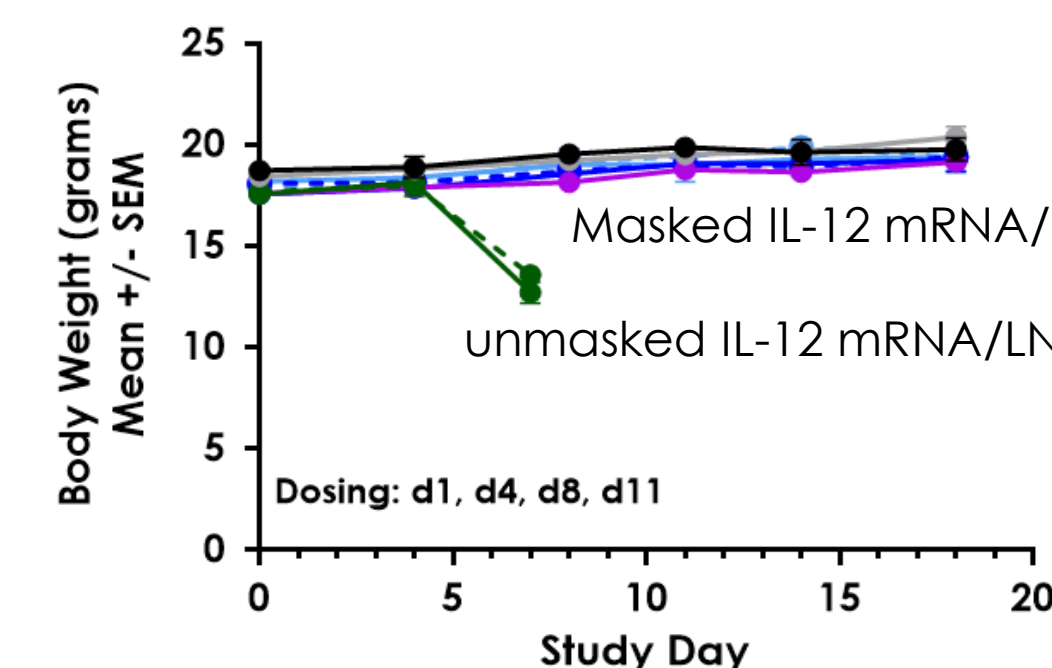

Efficacy of masked IL-12 mRNA/LNP in MC38 tumor mice model

- MC38 tumor-bearing mice were dosed with 0.03 or 0.1 mg/kg masked IL-12 mRNA/LNP 1x/week for 2 weeks or 2x/week for 2 weeks
- Unmasked IL-12 mRNA/LNP was evaluated at 10X lower doses (0.003 2x/week and 0.01 mg/kg 1x/week)
- Masked IL-12 mRNA/LNP demonstrated strong and long-lasting anti-tumor efficacy (animals remained disease-free 5 weeks post treatment)

Intravenous mRNA/LNP

mRNA-encoded masked IL-12 is well tolerated at 30X higher doses than mRNA-encoded unmasked IL-12

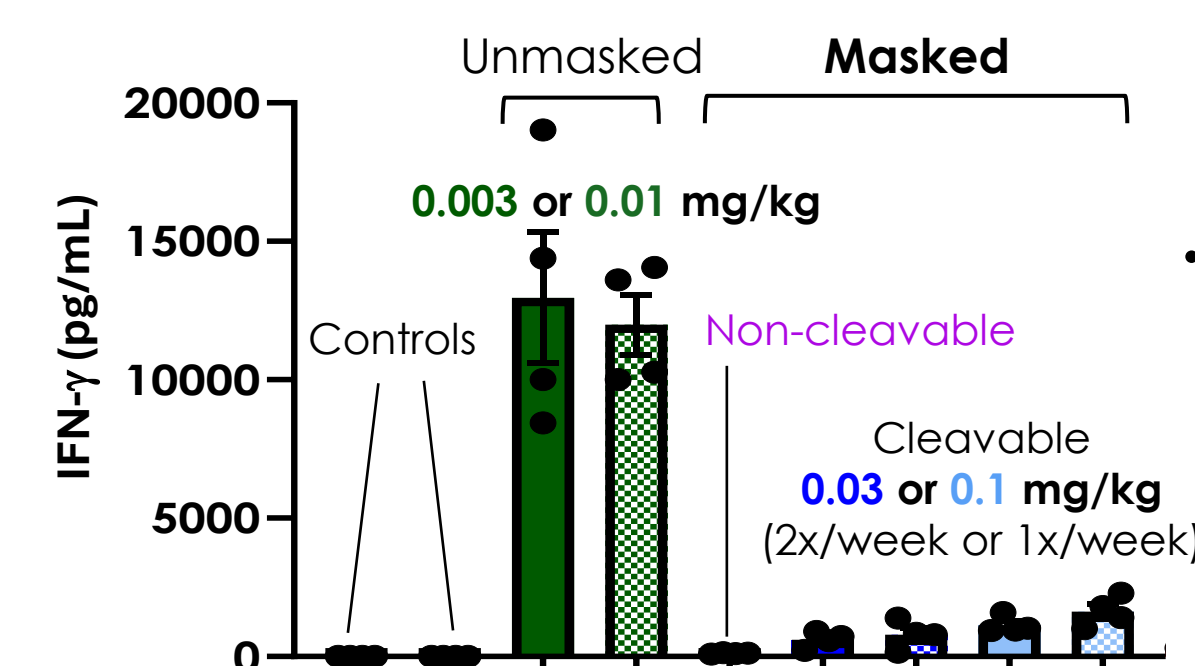

- No body weight loss in any group treated with masked IL-12 mRNA/LNP
- Mice treated with unmasked IL-12 mRNA/LNP did not survive post d7

- Animals treated with masked IL-12 mRNA/LNP have normal liver weights

Legend for Liver Weight graph:
□ PBS control
■ Non-translating mRNA/LNP control
■ Masked non-cleavable IL-12 mRNA/LNP 0.03 mg/kg, 1x/week
■ Masked cleavable IL-12 mRNA/LNP 0.03 mg/kg, 2x/week
■ Masked cleavable IL-12 mRNA/LNP 0.03 mg/kg, 1x/week
■ Masked cleavable IL-12 mRNA/LNP 0.1 mg/kg, 2x/week
■ Masked cleavable IL-12 mRNA/LNP 0.1 mg/kg, 1x/week

- Minimal peripheral activation of masked IL-12 post mRNA/LNP dosing (Plasma IFN-γ levels on day 4 post IL-12 mRNA/LNP dose)

Conclusions

- An mRNA-encoded masked IL-12 demonstrates >100x masking in vitro compared to mRNA-encoded unmasked IL-12
- The mRNA-encoded masked IL12 is systemically well-tolerated while showing robust and long-lasting anti-tumor efficacy in a tumor bearing mouse model
- These findings support the potential of mRNA-based masked IL12 as a safe and effective immunotherapy
